The CPI and Rate of Inflation

1. The CPI is an index or tool which measures price changes in goods and services with reference to a base period for which the index is set to equal 100. Any increase or decrease in this index reflects an increase or decrease in the price of the good or service compared to the price in the base period. Rapid increases in the index imply that the market structure is changing. The movement in index from one period to another can be expressed as a percentage change or changes in index points.
2. The Rate of Inflation on the other hand measures the rate at which the cost of a fixed basket of goods and services is changing over time. This is usually measured as a ratio of the average index over a twelve month period to the average index of the preceding twelve month period as shown in Table 1(b).

Price collection is done during the week of the 15th of every month. Any change in price of commodities that occur after the price collection week is reflected in the computations of the following month.
